Letter of Introduction

My name is Wassim Abdelkafi, and I am a civil engineering graduate trained in both Canada and Tunisia. My academic and professional background has enabled me to develop strong technical expertise in civil engineering, project coordination, site supervision, and quality control.

My journey in civil engineering began in Tunisia with technical training at the Institut Supérieur des Etudes Technologiques de Sfax, where I developed practical knowledge related to reinforced concrete, structures, site operations, and road infrastructure. I then continued my studies at the Institut International de Technologie to earn a bachelor's degree in civil engineering, which allowed me to further strengthen my technical and analytical skills.

During my university studies, I completed several technical internships that gave me an excellent understanding of site realities and civil infrastructure. My introductory internship at Adam Consulte in the building sector allowed me to participate in the follow-up of the construction of a reinforced concrete residential building, where I observed formwork, rebar placement, concreting, stripping, and compliance with drawings and specifications.

I later completed an advanced internship at Societe Chaabane et Cie in the field of road infrastructure, where I contributed to the technical follow-up of earthworks and civil structures. As part of my final-year project at the same company in Tunisia, I also participated in the follow-up of the construction of a road interchange connecting GP10 to Voie X. These experiences strengthened my skills in site supervision, road infrastructure, quality control, and technical coordination.

After arriving in Canada, I continued my studies at Université de Sherbrooke, where I completed both a graduate diploma and a Master of Applied Science in Civil Engineering. During my academic path in Sherbrooke, I also took part in two engineering development projects in rock mechanics, one focused on digital image correlation and the other on three-dimensional printing technologies. My master's research project focused on the characterization of basalt fiber-reinforced polymer bars used in reinforced concrete structures, which helped me develop advanced skills in applied research, technical analysis, and the evaluation of innovative solutions for sustainable infrastructure.

Professionally, I worked at Artelia in construction material testing, where I contributed to compression, gradation, and absorption testing to validate compliance with applicable standards. I also worked at AusculTECH as an inspector of reinforced concrete structures, carrying out visual and technical inspections as well as non-destructive testing including radar, corrosion, and resistivity assessments.

I currently hold the position of Engineering Technical Coordinator at De La Fontaine in Sherbrooke. In this role, I supervise and optimize 3D design, manufacturing, and technical order-processing activities for specialized projects. I also coordinate multidisciplinary teams located in Canada, Tunisia, and Mexico to ensure compliance with schedules, technical requirements, and quality standards.

Through this diverse background, I have developed strong skills in technical coordination, priority management, problem solving, site supervision, and multidisciplinary collaboration. I am proficient in AutoCAD, SolidWorks, Tekla Structures, Robot Structural Analysis, MS Project, and several technical tools used in civil engineering and project management. My application for admission to the Ordre des ingenieurs du Quebec, in order to officially obtain CPI status, was submitted on March 16, 2026 and is currently under review.

Thank you for your time and for reading this letter of introduction. I would be pleased to speak with you and provide any additional information if needed.
